

### 1. Curl Socket Example.

Sorry I write this in CWEB since its much easier to provide one file, while testing the dependencies of several libraries in one sourcecode file, which gets split during processing.

### 2. So lets start with the entry point and how this example is deployed.

```
#include <stdlib.h>
#include <stdio.h>
#include <string.h>
#include <unistd.h>
#include <curl/curl.h>
#include "qt-part.h"
< global operation data 3 >
< global functions 11 >
< curl callbacks 7 >
< curly functions 16 >
int main(int argc, char **argv)
{
    int io_channel_counter = 0;
    /* when no io channels are open anymore we can quit the application */
    struct global_data global;
    struct test_read_data *trd = calloc(1, sizeof(struct test_read_data));
    int code;
    curl_global_init(CURL_GLOBAL_ALL);
    create_test_app();
    trd->io_channel_counter = &io_channel_counter, io_channel_counter++;
    create_io_channel(0, 0, trd, test_read_cb); /* register stdin */
    global(curl = curl_multi_init());
    global.io_channel_counter = &io_channel_counter;
    io_channel_counter++;
    setup_curl_multi_urls(&global, "http://curl.haxx.se/download");
    while (CURLM_CALL_MULTI_PERFORM == (code = curl_multi_socket_all(global(curl, &globalhandles))) );
    exec_test_app();
    if (trd->some_fd_context) free(trd->some_fd_context);
    curl_multi_cleanup(global(curl));
    return 0;
}
```

### 3. Global operation data

```
< global operation data 3 > ==
struct global_data {
    CURLM *curl;
    int handles;
    int *io_channel_counter;
};
```

This code is used in section 2.

#### 4. Curl Functions.

##### 5. Setup a single URL.

```
void *setup_curl_url(struct global_data *global, const char *url)
{
    CURL *curl = curl_easy_init();
    struct url_opdat *url_dat = calloc(1, sizeof(struct url_opdat));
    url_dat->global = global;
    url_dat->url = malloc(strlen(url) + 1);
    strcpy(url_dat->url, url);
    curl_easy_setopt(curl, CURLOPT_WRITEFUNCTION, incoming_list);
    curl_easy_setopt(curl, CURLOPT_HEADERFUNCTION, incoming_list);
    curl_easy_setopt(curl, CURLOPT_WRITEDATA, url_dat);
    curl_easy_setopt(curl, CURLOPT_HEADERDATA, url_dat);
    curl_easy_setopt(curl, CURLOPT_NOBODY, 1); /* set a head request */
    curl_easy_setopt(curl, CURLOPT_URL, url);
    return curl;
}
```

##### 6. Setup a line of urls.

```
void setup_curl_multi_urls(struct global_data *global, const char *base_url)
{
    char url_buf[1024];
    unsigned i;
    CURL *curl;
    for (i = 0; i < 25; ++i) {
        sprintf(url_buf, "%s/curl-7.%d.0.tar.bz2", base_url, i);
        curl = setup_curl_url(global, url_buf);
        if (curl != NULL) {
            curl_multi_add_handle(global->curl, curl);
        }
    }
    curl_multi_setopt(global->curl, CURLMOPT_SOCKETFUNCTION, socket_cb);
    curl_multi_setopt(global->curl, CURLMOPT_SOCKETDATA, global);
}
```

## 7. Curl Callbacks.

```
{ curl callbacks 7 } ≡  
static void socket_cb(CURL *c, curl_socket_t fd, int action, void *inf, void *priv);  
static void io_socket_cb(void *iof, void *cb_vp, int fd);  
static size_t incoming_list(void *dat, size_t len, size_t n, void *req_vp);
```

This code is used in section 2.

## 8. Curl Socket Callback.

```

#define DEBUG_HANDLES 1
void socket_cb(CURL *c, curl_socket_t fd, int action, void *inf, void *priv)
{
    struct socket_opdat *dat = priv;
    struct global_data *global = inf;
#ifndef DEBUG_HANDLES
    fprintf(stdout, "CURL_SOCKET_CB_%d", fd);
#endif
    if (dat == NULL) {
        dat = calloc(1, sizeof(struct socket_opdat));
        dat->global = global;
        curl_multi_assign(global->curl, fd, dat);
    }
    switch (action) {
        case CURL_POLL_NONE:
#ifndef DEBUG_HANDLES
        fprintf(stdout, "NONE\n");
#endif
        break;
        case CURL_POLL_IN:
#ifndef DEBUG_HANDLES
        fprintf(stdout, "IN%p\n", dat);
#endif
        if (dat->out_iof) destroy_io_channel(&dat->out_iof);
        if (!dat->in_iof) dat->in_iof = create_io_channel(fd, 0, dat, io_socket_cb);
        break;
        case CURL_POLL_OUT:
#ifndef DEBUG_HANDLES
        fprintf(stdout, "OUT%p\n", dat);
#endif
        if (dat->in_iof) destroy_io_channel(&dat->in_iof);
        if (!dat->out_iof) dat->out_iof = create_io_channel(fd, 1, dat, io_socket_cb);
        break;
        case CURL_POLL_INOUT:
#ifndef DEBUG_HANDLES
        fprintf(stdout, "INOUT%p\n", dat);
#endif
        if (!dat->out_iof) dat->out_iof = create_io_channel(fd, 1, dat, io_socket_cb);
        if (!dat->in_iof) dat->in_iof = create_io_channel(fd, 0, dat, io_socket_cb);
        break;
        case CURL_POLL_REMOVE:
#ifndef DEBUG_HANDLES
        fprintf(stdout, "REMOVE%p\n", dat);
#endif
        if (dat->out_iof) destroy_io_channel(&dat->out_iof);
        if (dat->in_iof) destroy_io_channel(&dat->in_iof);
        if (dat != NULL) free(dat); /* FIXME DEBUG FIELDS */
        break;
    default:
#endif
}

```

```

    fprintf(stdout, "unkown\n");
#endif
        break;
    }
}

```

**9.** Curl IO Callback.

```

void io_socket_cb(void *iof, void *dat_vp, int fd)
{
    struct socket_opdat *dat = dat_vp;
    struct global_data *global = dat->global;
    int code;

    while (CURLM_CALL_MULTI_PERFORM == (code = curl_multi_socket_action(global->curl, fd, 0,
        &global->handles))) ;
    if (global->handles == 0) {
        close_io_channel(global->io_channel_counter);
    }
}

```

**10.** Curl incoming callback.

```

size_t incoming_list(void *dat, size_t len, size_t n, void *req_vp)
{
    struct url_opdat *url_dat = req_vp;
    char *buf;

    buf = malloc(len * n + 1);
    memcpy(buf, dat, len * n);
    buf[len * n] = '\0';
    if (len * n < 5) {
        free(buf);
        return len * n;
    }
    if (memcmp(buf, "HTTP/", 5) == 0) {
        unsigned p = 6;
        long http_code;
        int ok = 0;
        char *e;

        while (buf[p] != '\0' & p < len * n) ++p;
        if (buf[p] == '\0') {
            e = buf + p;
            http_code = strtol(buf + p, &e, 10);
            if (e > buf + p & e - buf < len * n) {
                if (e[0] == '\0') ok = 1;
            }
        }
        if (ok) {
            fprintf(stdout, "INCOMING[%s] :%ld\n", url_dat->url, http_code);
        }
    }
    free(buf);
    return len * n;
}

```

**11.** Closing any channel.

```
⟨ global functions 11 ⟩ ≡
void close_io_channel(int *io_channel_counter);
```

This code is used in section 2.

**12.** Global channel close counter.

```
void close_io_channel(int *io_channel_counter)
{
    if (*io_channel_counter > 1) (*io_channel_counter)--;
    else call_test_app_quit();
}
```

**13.** Each url gets some operation data.

```
⟨ curl multi operation data 13 ⟩ ≡
struct url_opdat {
    struct global_data *global;
    char *url;
};

struct socket_opdat {
    struct global_data *global;
    void *out_iof, *in_iof;
};
```

This code is used in section 16.

**14.** Two functions create the complete curl setup.

```
⟨ curl multi setup 14 ⟩ ≡
extern void setup_curl_multi_urls(struct global_data *global, const char *base_url);
extern void *setup_curl_url(struct global_data *global, const char *url);
```

This code is used in section 16.

**15. Simple Functions.** A simple read function.

```
void test_read_cb(void *iof, void *dat, int fd)
{
    char buf[1024];
    struct test_read_data *trd = dat;
    int nread = 0;

    nread = read(fd, buf, 1024);
    if (nread <= 0) {
        fprintf(stdout, "close_on_%d\n", fd);
        destroy_io_channel(&iof);
        close_io_channel(trd->io_channel_counter);
    }
    else fprintf(stdout, "read_%d_bytes_from_%d\n", nread, fd);
    trd->status = 0;
}
```

**16.** The curl specific functions, data types and callbacks

⟨ curly functions 16 ⟩ ≡  
   ⟨ curl multi operation data 13 ⟩  
   ⟨ curl multi setup 14 ⟩  
   ⟨ test read record 17 ⟩  
   ⟨ test read cb 18 ⟩

This code is used in section 2.

**17.** The Test read simply reads out a socket or file descriptor.

⟨ test read record 17 ⟩ ≡  
   struct test\_read\_data {  
     char \*some\_fd\_context;  
     int status;  
     int \*io\_channel\_counter;  
   };

This code is used in section 16.

**18.**

⟨ test read cb 18 ⟩ ≡  
   extern void test\_read\_cb(void \*iof, void \*dat, int fd);

This code is used in section 16.

**19.** Export an Interface for C.

```
<qt-part.h 19> ≡
#ifndef _QT_PART_H_
#define _QT_PART_H_ 1
#if defined __cplusplus
    extern "C"
{
#endif
<Preprocessor definitions>
    <qt application prototypes 24>
    <qt io prototypes 22>
#endif
#endif
#endif
```

**20. Qt Part of the test.** The Qt Part of this test consists of a simple QApp creation and the IO mechanism.

```
⟨ qt-part.cc 20 ⟩ ≡  
  ⟨ qt application code 25 ⟩  
  ⟨ qt io events 23 ⟩  
#include "moc_qt-part.cc"
```

## 21. Asynchronous Operation:IO.

22. Prototypes for io to export some functions to "C".

```
<qt io prototypes 22> ≡
typedef void(*call_io_function)(void *iof, void *dat, int fd);
extern void *create_io_channel(int fd, int type, void *dat, call_io_function f);
extern void destroy_io_channel(void **X);
extern void enable_io_channel(void *ios_ptr, int enable);
```

This code is used in section 19.

23. IO Event Class specification.

```
<qt io events 23> ≡
#include <QtCore/QSocketNotifier>
class ProgramIOSelect : public QSocketNotifier { Q_OBJECT
public: ProgramIOSelect(QObject *parent, void *dat, call_io_function ciof, int fd, unsigned type)
    : QSocketNotifier(fd, (QSocketNotifier::Type) type, parent), m_data(dat), m_io_function(ciof) {
    connect(this, SIGNAL(activated(int)), this, SLOT(call_io(int)));
    setEnabled(true);
}
public slots : void call_io(int fd)
{
    m_io_function(this, m_data, fd);
}
private: void *m_data;
call_io_function m_io_function; } ;
void *create_io_channel(int fd, int type, void *dat, call_io_function f)
{
    ProgramIOSelect *new_io = new ProgramIOSelect(A, dat, f, fd, type);
    return new_io;
}
void destroy_io_channel(void **X)
{
    ProgramIOSelect *del_io = (ProgramIOSelect *)(*X);
    del_io->setEnabled(false);
    delete del_io;
    *X = A;
}
void enable_io_channel(void *ios_ptr, int enable)
{
    ProgramIOSelect *io = (ProgramIOSelect *) (ios_ptr);
    io->setEnabled(enable);
}
```

This code is used in section 20.

#### 24. Qt Application Part.

```
<qt application prototypes 24> ≡
extern void *create_test_app();
extern void call_test_app_quit();
extern void exec_test_app();
```

This code is used in section 19.

#### 25.

```
#define TApp ( ( TestApp * ) get_test_app() )
<qt application code 25> ≡
#include <QtCore/QCoreApplication>
#include "qt-part.h"
static char *_m_argv[2] = {"it'sme", NULL};
static int _m_argc = 1; class TestApp : public QCoreApplication { Q_OBJECT
public: TestApp()
    : QCoreApplication(_m_argc, _m_argv) { }
~TestApp()
{ } } ;
void *create_test_app()
{
    return new TestApp();
}
void *get_test_app()
{
    return QCoreApplication::instance();
}
void call_test_app_quit()
{
    TApp->quit();
}
void exec_test_app()
{
    TApp->exec();
}
```

This code is used in section 20.
